

Employee Attrition Prediction – Executive Summary

Employee Attrition Analysis Summary

Objective

The objective of this project was to identify employees who are at a higher risk of leaving the company using historical HR data. By understanding the factors associated with employee attrition, HR teams can take proactive steps to improve employee retention and reduce the costs associated with recruitment, onboarding, and productivity loss.

Key Findings

The analysis showed that approximately **16% of employees** in the dataset left the company. The **Sales department** experienced the highest attrition rate, while **Sales Representatives** had the highest employee turnover among all job roles.

Employees with **lower monthly income**, **frequent overtime**, **lower work-life balance**, and **fewer years with the company** were more likely to leave. Factors such as employee age and total work experience also played an important role in predicting attrition.

Recommendations

Based on these findings, HR should prioritize retention efforts for employees working in the Sales department, particularly Sales Representatives. Regular one-on-one discussions, career development opportunities, and workload reviews may help reduce employee turnover.

Improving work-life balance by limiting excessive overtime and introducing flexible work arrangements could also improve employee satisfaction and retention. Reviewing compensation and benefits for employees in high-risk groups may further reduce attrition.

Conclusion

This analysis demonstrates that employee attrition is influenced by multiple factors rather than salary alone. By using predictive analytics alongside HR expertise, organizations can identify employees who may be at risk of leaving and take proactive measures to improve retention. Although the model provides valuable insights, it should be used as a decision-support tool rather than a replacement for human judgment, as individual career decisions may also depend on personal and organizational factors that are not included in the available data.
